# ExamNotes AI

## Sub Topics (Priority Wise)

High Priority:
• HTML Basics
• CSS Styling

Medium Priority:
• JavaScript Basics

## Detailed Notes

1. HTML Basics (high)
HTML is the skeleton of a web page. It uses tags like <html>, <head>, <body>, <h1> to <h6>, <p>, <a>, <img>, etc. Tags can have attributes such as id, class, src, href. Semantic tags like <header>, <footer>, <article> help browsers and developers understand structure. The document starts with <!DOCTYPE html> to specify HTML5.

2. CSS Styling (high)
CSS styles the look of HTML elements. Selectors target elements: element, .class, id, descendant, child. Box model: content, padding, border, margin. Positioning: static, relative, absolute, fixed, sticky. Flexbox and Grid help create responsive layouts. Media queries adjust styles for different screen sizes.

3. JavaScript Basics (medium)
JavaScript adds interactivity. Variables declared with var, let, const. Functions perform actions. Events like click, load trigger code. DOM (Document Object Model) represents page as nodes; JavaScript can change content, attributes, styles. Basic syntax:
document.getElementById('id').innerText = 'Hello';

4. (n/a)

5. (n/a)

6. (n/a)

## Revision Points

• HTML uses tags to structure content.
• CSS styles the appearance of elements.
• The box model defines content, padding, border, and margin.
• JavaScript manipulates the DOM to add interactivity.
• Browsers follow a rendering pipeline to display pages.
• HTTP methods determine how data is sent to the server.
• Status codes indicate success or failure of requests.
• URLs identify resources on the web.
• Semantic tags improve accessibility and SEO.

• Version control tracks changes and collaborates with others.

## Important Questions

### Short Questions:

• What is the purpose of the <!DOCTYPE html> declaration?
• Explain the difference between id and class selectors in CSS.
• How does JavaScript access an element by its id?
• What is a media query used for?
• Name two HTTP methods used to send data to a server.

### Long Questions:

• Explain the role of CSS in web development and describe how the box model works.
• Describe the process a browser follows to render a web page, including key steps and data structures involved.
• Discuss the importance of semantic HTML tags and how they benefit accessibility and SEO.
• Explain how JavaScript can be used to create dynamic content on a web page and give an example.

### Diagram Question:

Draw a flowchart showing the steps a browser takes to render a web page.
